Hey Arri

Hey Arri, Flora's voice command

CONTENTS

- 2 Getting started
- 3 How to talk to Arri
- 4 Commands that work everywhere
- 5 Commands by screen
- 6 Complete example phrases
- 7 If Arri doesn't understand, or doesn't wake up
- 8 Privacy

Talk to Flora like a patient gardener: say "Hey Arri", wait for the orange glow, then give your command: "disease", "photo", "read"... Flora obeys without you touching the screen. The word "Hey Arri" is recognised right on your phone; the command that follows is turned into text by Apple's or Google's speech recognition, just like any dictation.

2 Getting started

1. **Turn Hey Arri on:** Settings (the copper porthole with the green Arritos logo, in the top-right corner of the home screen) > in the arc of orchids, the orange **Hey Arri** flower > touch the big orb. Flora will then ask for microphone access (and, on iPhone, speech recognition) — allow it so Arri can hear you.
2. **Pronunciation:** say "Hey Arri" like "hey, Harry" without the H. A "Hear how to say it" button plays an example if you're unsure.
3. **Sensitivity:** three settings — **Calm** · **Normal** · **Responsive**. Arri wakes up on his own? Pick Calm. He doesn't hear you? Pick Responsive. Normal is the default. It can only be changed once Hey Arri is on (until then, it's greyed out).
4. **Test the mic:** a dedicated button walks you through three steps — the gauge should move, then say "Hey Arri", then a command (nothing actually runs during the test, it's just to check it works). The test also needs Hey Arri to be on: otherwise the button is greyed out and the page shows "Turn on Hey Arri to test the mic."
5. **The home screen mic:** on the home screen, a mic icon (next to History) listens for **one single command without saying "Hey Arri"** — handy for a quick one-off, whether or not Hey Arri is turned on.

3 How to talk to Arri

The two-step principle: say "Hey Arri", wait for the **orange glow** around the screen, then say your command — you have up to **about 12 seconds** for your command. On iPhone, though, a pause of about 3 seconds ends the listening, so start speaking as soon as the glow appears. While Arri is listening, the home screen's ambient sound (birdsong and lapping water) is turned down or muted so it can hear you better.

On the scan camera, once a voice command has opened it, **listening reopens on its own about 1.2 seconds later** (when Hey Arri is turned on): you can say "photo" or "scan" straight away without repeating "Hey Arri".

A few tips: speak at a normal distance (as if to someone in the same room), in a room that isn't too noisy (turn off music or the TV if you can), and speak **naturally**, as one sentence — no need to over-articulate.

4 Commands that work everywhere

These commands work on **any screen**, as soon as you've said "Hey Arri".

Getting around

TO...	SAY (ANY OF THESE)	WHAT HAPPENS
go back to the home screen	"home" · "home screen" · "main screen" · "main menu" · "menu" · "go home"	returns to the home screen
go back one step	"back" · "go back" · "return" · "previous" · "close" · "close it" · "dismiss" · "exit" · "cancel" · "previous page"	goes back to the previous screen (closes an open bubble or dialog)

TO...	SAY (ANY OF THESE)	WHAT HAPPENS
open Settings	"settings" · "setting" · "preferences" · "preference" · "options" · "option" · "setup" · "set up"	opens the Settings menu
open History	"history" · "my scans" · "past scans" · "previous scans" · "my results"	opens your scan history
reopen your latest result	"last scan" · "latest scan" · "last result" · "the last one" · "latest"	opens your most recent result directly
reopen your latest Disease result	"last diagnosis" · "last disease"	same, filtered to Disease results
reopen your latest Care result	"last care" · "last care sheet"	same, filtered to Care results
reopen your latest Specimen result	"last specimen"	same, filtered to Specimen results

For a filtered result, you can also say "last", "latest", "my last" or "my latest" followed by the scan's name (see "Starting a scan" below): "latest diagnosis", "latest care", "my last specimen" ...

Opening a Settings page

Just say the page's name, from anywhere — Flora takes you straight there (Settings opens on its own if needed).

PAGE	SAY (ANY OF THESE)
About	"about" · "about flora" · "credits" · "version"
Contact	"contact" · "contact us" · "support"
Web	"web" · "website" · "websites" · "sites" · "links"
Language	"language" · "languages" · "change language"
Account	"account" · "my account" · "profile"
Info	"info" · "information" · "how it works" · "faq" · "frequently asked questions" · "guide" · "privacy"
Hey Arri	"voice control" · "voice commands" · "hey arri settings" · "microphone" · "mic"
Aristote & audio	"aristote" · "aristotle" · "aristote and audio" · "audio" · "sound" · "voice" · "his voice"
Modules	"modules" · "apps" · "other apps" · "ecosystem"

Two words with a double meaning: said **on its own**, "mic" always opens the Hey Arri page (except in the "Ask" bubble, where it means "let me dictate my question"); said **on its own**, "sound", "audio" or "voice" always opens the Aristote & audio page.

Starting a scan

Just say the scan's name — you can also put an optional word in front: "scan" · "start" · "run" · "do a" · "new" · "launch" · "start a" · "run a" .

SCAN	SAY (ANY OF THESE)
Disease	"disease" · "diagnosis" · "diagnose" · "diagnostic" · "sickness" · "health check" · "diagnoses" · "sick" · "health" · "problem" — or as a question: "what's wrong" · "what is wrong"
Care	"care" · "care sheet" · "maintenance" · "caring" · "look after" · "upkeep" — or as a question: "how to care for it"
Specimen	"specimen" · "specimens" · "identify" · "identification" · "plant name" · "identify it" · "recognise" · "recognize" — or as a question: "what plant is this" · "what is this plant" · "name this plant" · "what flower is this" · "what is this flower"

The question forms ("what's wrong" ...) go to **Aristote** if you're on a result that allows a question or in the "Ask" bubble. Anywhere else they launch the matching scan, except in History, where they filter the list to that type.

Language

Just say the language's name — on its own, or after a word like "language..." , "switch to..." , "speak..." , "set..." , "in..." .

LANGUAGE	SAY
French	"french" (or its native name "Français" , always accepted)
English	"english"
Spanish	"spanish" (or "Español")
Russian	"russian" (or "Русский")

Example: "Hey Arri, french" : from any screen, Flora opens Settings > Language, switches to French and Aristote confirms out loud in French ("Je parle français."). After that, give your commands in French. A few English words ("home" , "help" , "settings" , "history" , "photo" , "scan" ...) and the name "English" still work, so you can always switch back.

Sounds and auto-read

TO...	SAY	WHAT HAPPENS
turn the app's sounds off	"sound off" · "sounds off" · "mute" · "turn the sound off" · "disable sounds" · "turn off the sound" · "turn off sounds" · "turn sound off"	turns the app's sounds off (not Aristote's voice, which always keeps talking)

TO...	SAY	WHAT HAPPENS
turn the sounds back on	"sound on" · "sounds on" · "unmute" · "turn the sound on" · "enable sounds" · "turn on the sound" · "turn on sounds" · "turn sound on"	turns the app's sounds back on
turn auto-read on	"auto read on"	Aristote reads every new result on his own (this is the default)
turn auto-read off	"auto read off"	you need to say "read" to hear it

Quieting Arri, asking for help, turning Hey Arri off, volume

TO...	SAY	WHAT HAPPENS
quiet Aristote	"stop" (on its own, as a whole sentence) · "stop reading" · "stop talking" · "quiet" · "be quiet" · "silence" · "hush" · "shut up" · "enough" · "pause"	stops Aristote's voice — never closes a page, never cancels an ongoing analysis
see the commands for this screen	"help" · "what can i say" · "what can i do" · "commands" · "list commands" · "voice help" · "help me"	opens the "What can I say?" card for the screen you're on
turn Hey Arri off	"turn off hey arri" · "disable hey arri" · "deactivate hey arri" · "stop listening" · "mic off" · "microphone off" · "turn off the mic" · "turn off the microphone" · "turn the mic off"	puts Hey Arri to sleep (it can't be turned back on by voice, by design: go through Settings > Hey Arri)
change the volume	"louder" · "speak up" · "volume up" · "quieter" · "volume down" · "volume"	Arri simply tells you to use your phone's volume buttons

What voice never does

Clearing your history, deleting a result, signing out or deleting your account: even if you say it ("clear history", "clear all", "delete", "delete this", "sign out", "log out", "delete my account" ...), Arri **does nothing**. At most it opens the relevant page and tells you to confirm by touch.

5 Commands by screen

These commands only work **on the screen where they're listed**.

Scan camera

TO...	SAY	WHAT HAPPENS
take the photo	"photo" · "picture" · "take the photo" · "take a photo" · "take a picture" · "capture" · "scan" · "scan it" · "take the picture" · "take photo" · "take picture" · "snap" · "shoot" · "cheese" · "analyse" · "analyze" · "go" · "now"	triggers the capture, as if you'd touched the orb

Saying **another** scan's name (say, "care" while you're on Disease) switches straight to that scan. Saying the name of the scan you're already on gets the reply: "You're there: frame the plant, then say "photo "."

On a result (Disease, Care or Specimen)

TO...	SAY	WHAT HAPPENS
hear the result again	"read" · "read it" · "read it again" · "read the result" · "listen" · "read it to me" · "read to me" · "read me the result" · "repeat" · "say it again" · "again" · "one more time" · "tell me" · "what did you say"	Aristote reads (or re-reads) the result out loud
retake the photo	"new photo" · "another photo" · "retake" · "take another" · "photo" · "new scan" · "start over" · "another plant"	reopens the camera for a new photo
share the result	"share" · "share it" · "share the result"	opens the share sheet
ask Aristote a question	"ask" · "ask aristote" · "ask aristotle" · "question" · "i have a question" · "ask a question"	opens the "Ask" bubble and starts listening for your question
see similar plants (Specimen only)	"similar plants" · "similar" · "plants like this"	opens a Google search for look-alike plants in your browser (like the Similar plants orb)
see growing tips (Specimen only)	"recommendation" · "growing" · "growing tips"	opens a Google search for growing tips for this plant in your browser (like the Recommendation orb)

Two faster ways to ask a question: say the trigger word **followed directly by your question** ("ask how often should I water it" — the question is sent automatically 1.5 s later); or ask your question **directly**, with no trigger, if it's 3 words or more and starts with "how", "when", "why", "what", "where", "which", "should", "can", "could", "is", "are", "does", "do", "will", "would"... — for example: "Hey Arri, how often should I water it?".

On a Specimen result, saying "history" opens your history **already filtered** to Specimens (instead of the full history).

During analysis (the "Aristote is observing" screen)

Only three commands work: "back" or "home" (cancel the analysis, just like touching the back arrow would) and "quiet" (simple silence, but the analysis keeps going). Any other command gets the reply: "Aristote is still observing... Say "back" to cancel."

On an error screen

TO...	SAY	WHAT HAPPENS
try again	"try again" · "retry" · "again" · "one more time" · "start over" · "photo" · "new photo"	reopens the camera so you can take the photo again (listening reopens on its own: just say "photo")

In the "Ask" bubble (asking Aristote)

TO...	SAY	WHAT HAPPENS
send the question	"send" · "send it" · "submit" · "ask it" · "done"	sends the question to Aristote
dictate (the big mic)	"mic" · "microphone" · "dictate" · "listen to me" · "question"	starts dictating your question
pick idea 1	"first idea" · "the first one" · "idea one"	fills the field with the 1st suggested idea
pick idea 2	"second idea" · "the second one" · "second"	fills the field with the 2nd suggested idea
pick idea 3	"third idea" · "the third one" · "third"	fills the field with the 3rd suggested idea
clear the question	"clear" · "clear it" · "erase" · "clear the question"	empties the field
hear the last answer again	see "hear the result again" above (same words: "read", "repeat" ...)	Aristote reads his last answer again

The ideas can only be picked while they're shown on screen: the field is empty, no answer is on its way, and you haven't asked your first question yet.

You can also ask your question **directly**, with no trigger word: any unrecognised sentence of 3 words or more becomes your question.

In History

TO...	SAY	WHAT HAPPENS
show everything	"all" · "show all" · "everything"	removes the filters
filter by a type	say the scan's name on its own (see "Starting a scan" above), or "only" / "just" followed by it ("only care")	filters history to that type (instead of starting a new scan)
start a new scan	a starting word in front of the scan's name: "new diagnosis", "start a care scan" ...	starts that scan
open the most recent result	"open the first one" · "the latest" · "the last one" · "latest"	opens the top result in the list

TO...	SAY	WHAT HAPPENS
open a specific result	an ordinal or a number, 1 to 10 ("open the third one" , "sheet 2" , "number 5" ...) — among others: first/one, second/two, third/three, fourth/four, fifth/five, sixth/six, seventh/seven, eighth/eight, ninth/nine, tenth/ten	opens the n-th visible result, top to bottom

Settings › Language (sub-page)

TO...	SAY	WHAT HAPPENS
pick a language	say its name, on its own or after "language..." , "switch to..." (see "Language" table above)	switches straight to that language

Settings › Aristote & audio (sub-page)

TO...	SAY	WHAT HAPPENS
hear a sample of his voice	"listen to aristote" · "sample"	plays a clip of Aristote's voice

The "auto read" and "sound" commands (see "Sounds and auto-read" above) also work here.

Settings › Info (sub-page)

TO...	SAY	WHAT HAPPENS
open "How it works"	"how it works"	opens that section
open the FAQ	"faq"	opens the FAQ

Settings › Hey Arri (sub-page)

TO...	SAY	WHAT HAPPENS
test the mic	"test the mic" · "test"	starts the mic test described in §2
raise the sensitivity	"more sensitive"	moves one notch up (towards Responsive)
lower the sensitivity	"less sensitive"	moves one notch down (towards Calm)

Other Settings pages (About, Contact, Web, Account, Modules)

No special commands: say the page's name from anywhere (see "Opening a Settings page") to get there; once there, only the everywhere commands (§4) apply.

6 Complete example phrases

1. "Hey Arri, disease" then, facing the plant: "photo" .
2. "Hey Arri, specimen" then, once the camera is up (no need to say "Hey Arri" again): "scan" .

3. "Hey Arri, read" — on a result, Aristote reads it again.
4. "Hey Arri, history" then "Hey Arri, open the second one".
5. "Hey Arri, french" — from anywhere, Flora opens Settings > Language and switches to French, and Aristote confirms in French.
6. "Hey Arri, how often should I water it?" — asked on a result, the question goes straight to Aristote.
7. "Hey Arri, new photo" — to start a scan over from its result.
8. "Hey Arri, help" — any time except during an analysis, to see the commands for the screen you're on.

7 If Arri doesn't understand, or doesn't wake up

- **He doesn't wake up:** move a bit closer, speak a little louder, say it the English way ("hey, Harry" without the H — listen to the example in Settings > Hey Arri > Pronunciation). If it keeps happening, switch Sensitivity to **Responsive**.
- **He wakes up on his own, without being called:** switch Sensitivity to **Calm**.
- **He hears you but doesn't understand your command:** turn off music or the TV if you can, speak normally, one simple sentence at a time, and repeat your command ("photo", "history"...).
- **Not sure what to say:** say "help" any time (except while Aristote is observing) — Arri shows you the commands for the screen you're on.
- **Still stuck:** use the Mic test (Settings > Hey Arri > Test) to check your phone is picking up your voice properly.

8 Privacy

The word "Hey Arri" is recognised right on your phone, with nothing sent anywhere. The command that follows is turned into text by Apple's speech recognition (iPhone) or Google's (Android), depending on your phone — Flora never records your voice. Arri only listens while Flora is open on screen, never in the background: the small microphone dot at the top of the screen reminds you.
